

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

of the American Folk-Lore Society was held with the following result:

The officers elected for the season of 1895-96 are as follows: President, Mr. E. Francis Hyde; First Vice-President, Mr. George B. Grinnell; Secretary and Treasurer, Mr. William Burnet Tuthill; as members of the Executive Council, Mrs. Henry Draper, Mrs. Mary J. Field and Mrs. E. Francis Hyde. The offices of Second Vice-President and the fourth lady member of the Executive Council were not filled, the places being held vacant for the action of the Executive Council.

It was determined to hold the final meeting of the season on the evening of Tuesday, May the 7th, at the Hotel Waldorf. The speaker for the evening will be Dr. Matthews, of Washington, the subject being Navahoe Myths, illustrated by phonograph. It is also the intention of the Council to have four meetings during the coming season; three of them to be held at the Hotel Waldorf and one at the Museum of Natural History. At the meetings held at the Hotel Waldorf the members of the Society will be entertained after the reading of the paper.

Wm. B. TUTHILL, *Secretary.*

THE NEW YORK MINERALOGICAL CLUB.

At the last meeting of the New York Mineralogical Club the following officers were elected for the ensuing year: President, George F. Kunz; Secretary, Professor Daniel S. Martin; Treasurer, J. W. Freckleton; Executive Committee, E. Schernikow, Dr. E. S. Arnold and Professor A. H. Chester; Curators, Professor R. P. Whitfield, Gilman S. Stanton and William Niven; Committee on Admissions, J. McCarthy and Frederick Kato; Committee on Executions, J. S. Walker, Professor D. S. Martin and Frederick Kato; Delegates to Scientific Alliance, George F. Kunz, Professor D. S. Martin and J. W. Schoonmaker.

SCIENTIFIC JOURNALS.

THE ASTROPHYSICAL JOURNAL, APRIL.

Recent Researches on the Spectra of the Planets,
II.: H. C. VOGEL.

A summary of recent work on Jupiter, Saturn and Uranus. Photographic observations reveal no deviation in their spectra from that of the sun, but in the less refrangible region bands due to the absorption in the atmospheres of the planets have been recorded visually. A comparison of the visual spectrum of Uranus as mapped by Keeler and by Vogel shows little variation. Repeated observations on the red spot of Jupiter indicate no difference between its spectrum and that of the belts. From a study of the red region, the satellites probably have atmospheres similar to that of the primary. The spectra of Saturn and the ansæ of the ring on each side are identical in the more refrangible portion. That there is no absorption band at $\lambda 618 \mu\mu$ indicates the absence of an atmosphere around the rings.

On the Periodic Changes of the Variable Star Z Herculis: N. C. DUNÉR.

After discussing various observations upon this variable and giving its ephemeris, the writer concludes that *Z Herculis* is a connecting link between the *Algol* and the *Y Cygni* types, differing from *Algol* in having both components bright, and from *Y Cygni* in that the components are of unequal brightness. It consists of two stars of equal size, one of which is twice as bright as the other. The stars revolve in 3 days, 23 hours, 48 minutes, 30 seconds, in an elliptical orbit whose semi-major axis is six times the diameter of the stars. The plane of the orbit passes through the sun.

Preliminary Table of Solar Spectrum Wave-length, IV.: H. A. ROWLAND.

The table is continued from $\lambda 4266$ to 4414 .

T. Andromedæ: E. C. PICKERING.

A study of later photographs indicate that

the period of this variable, which was 281 days during 1891-1894, has changed for 1896.

Eclipse of Jupiter's Fourth Satellite, February 19, 1895: E. C. PICKERING.

A photometric observation before and after eclipse, compared with the second satellite.

Spectrum of Mars: LEWIS E. JEWELL.

A spectroscopic study of the water vapor of the earth's atmosphere shows that, unless the amount of water in the atmosphere of Mars is greater than that in the earth's atmosphere, it is useless to look for it there, with our present instruments. The chances for detecting oxygen and chlorophyl are better.

On a New Method of Mapping the Solar Corona: GEORGE E. HALE.

A method for using the differential bolometer. Evidence is offered that the heat radiation of the corona could be differentiated from that of the adjacent sky. If one member of the bolometer be exposed to a portion of the sky just beyond the coronal region, and the other member set successively on different parts of the coronal image, the galvanometer would indicate the varying radiation of heat intensity. Methods are also proposed for reducing the galvanometer readings to a form suitable for comparison with actual photographs of the corona.

On a New Form of Spectroscope: C. PULFRICH.

A translation from the *Zeitschrift für Instrumentenkunde*, describing a modification of the Littron spectroscope.

Minor Contributions and Notes.

Photographic Correcting Lens for Visual Telescopes: JAMES E. KEELER.

The Color of Sirius in Ancient Times: W. T. LYNN.

On the Variability of Es.-Birm. 281: T. E. ESPIN.

The Displacement of Spectral Lines Caused by the Rotation of a Planet: JAMES E. KEELER.

Dr. Pulfrich's Modification of the Littrow Spectroscope.

A list of the titles of recent publications on astrophysical and allied subjects appearing since the last number is a feature of each issue.

THE PHYSICAL REVIEW, MARCH-APRIL, 1895.

The leading article in this number of the *Review* is one by Dr. A. S. Mackenzie, *On the attractions of Crystalline and Isotropic Masses at Small Distances*. The primary object of the paper is to give in detail the methods and results of an investigation made for the purpose of determining whether, within the errors of observation, there is any deviation from the law of Newton in the case of attracting crystalline matter with reference to its optic axis, and the author gives also the results of some experiments made with a view to testing the application of the same law in the case of isotropic matter at small distances.

Physicists do not yet fully appreciate the value of the ingenious device suggested by Professor Boys through which they have lately been able to use quartz fibres, which furnish a mode of suspending small masses far ahead of anything before made use of in stability or constancy of torsional resistance. Like many other apparently minor discoveries or inventions, the introduction of the quartz fiber has greatly enlarged the opportunities of the experimentalist, in that it provides a ready means of measuring forces so minute as to have been thought until recently quite beyond our reach. The solution of problems relating to near attractions has especially been forwarded by this device, as Professor Boys has himself shown in several able and important investigations. In the paper under consideration Dr. Mackenzie describes the apparatus used in studying the attraction of crystalline

masses. It is simple but effective, and so delicate in its indications that the utmost care was necessary to avoid interference from external causes, often difficult to control. Full details are given, as they are of great interest, especially to those who contemplate the use of a quartz torsion fibre. It is interesting to note that the author was never able, throughout a long series of experiments, to control absolutely the zero point of his balance. Although quartz is enormously superior to any other suspension thus far proposed, it is still defective in this respect. For some cause which Dr. Mackenzie is unable to give, the zero was constantly shifting. He does not clearly say whether this partakes of the nature of a 'drift' in one direction or not. In a long series of experiments, made by direction of the writer of this notice, for the purpose of trying to improve the existing form of the vertical force magnetometer, quartz fibres were used. Although apparently well protected from convection currents and changes in temperature, the mirror attached to them was never actually at rest. When this shifting and drifting is small, as it usually is, and observations are of the nature of those described by Dr. Mackenzie, that is, not in themselves extending over long periods, the error arising from it may be readily and correctly eliminated.

The apparatus used for observing the attraction of isotropic masses was of the same character, and similar to that used by Professor Boys. The conclusion reached, the experimental results being in agreement within one or two-tenths of one per cent., is that neither in the case of crystalline nor isotropic masses was any deviation from the law of Newton detected. The author fails to note the very ingenious and interesting method of attacking the problem of the attraction of crystalline masses proposed by Poynting in his Adams Prize Essay on the Density of the Earth. Poynting proposes to test the

question of there being different properties as to attraction along different axes of crystals by the *directive action* which must exist when one sphere of a crystal is in the field of another. He made some experiments along that line, and his work probably preceded by a year or two that of Dr. Mackenzie. At the present moment, with library out of reach, I am unable to say whether he has published any further results.

The *Influence of Temperature on the Transparency of Solutions*, by E. S. Nichols and Mary C. Spencer, is another prominent article of the Review. Transparency to various wave-lengths was tested and a number of color solutions were examined. There are also papers on the Electric Conductivity of Certain Salt Solutions, by A. C. MacGregory, a continuation of the paper on Forces between Fine Solid Particles totally Immersed in Liquids and among the minor contributions is one interesting and useful on the Variation of Internal Resistance of a Voltaic Cell with Current, by Professor Carhart.
